Machine Learning
Project-Phase 2

In this phase we will focus on visualization and preprocessing of our selected datasets.

1) **Visualization of data for analysis**
   a) **Statistical Analysis:**
   After loading dataset print top rows and view them after that print different stats and visualize them as we have done in class.
   Example of stats: Check stats of your data with describe, check which features have missing values and more as required by your dataset.

   b) Visual Analysis:
   Make different figures/plots and try your best to understand distribution of different features in your data through those plots. Number and type of plots depends on your dataset and you will have to decide which plots will be good for your dataset.
   As explained in class, if you find some missing data or some abnormality or anything interesting then mention it below that figure/plot.

2) **Preprocessing**
   After you have visualized stats and plots of your dataset, now you can apply different preprocessing techniques. You can decide which features are irrelevant and you can drop them e.t.c. If you apply any preprocessing technique or drop any feature mention its reason below that code section in kaggle notebook.

Note:

1) In visualization part you don't have to write details below each and every stat or plot, write only where you feel its required. In preprocessing you have to justify each and evey step with a reason so, write reason in text below everything which you do.
2) Sometimes it might happen that few of your features are in a form that they can't be viualized with a figure. So, you might have to preprocess that feauture first and after that visualize it.

Time saving technique for future phases of project:
At the end of your kaggle notebook make sure you save your preprocessed dataset in csv format for using in next phase of project. So, in next phases instead of loading raw data you will load this csv file it will save time required by your notebook to run code for visuzaliation and preprocessing.

Best Wishes
